How does Docker Work? Is Docker still relevant?

We just made a video on this topic.
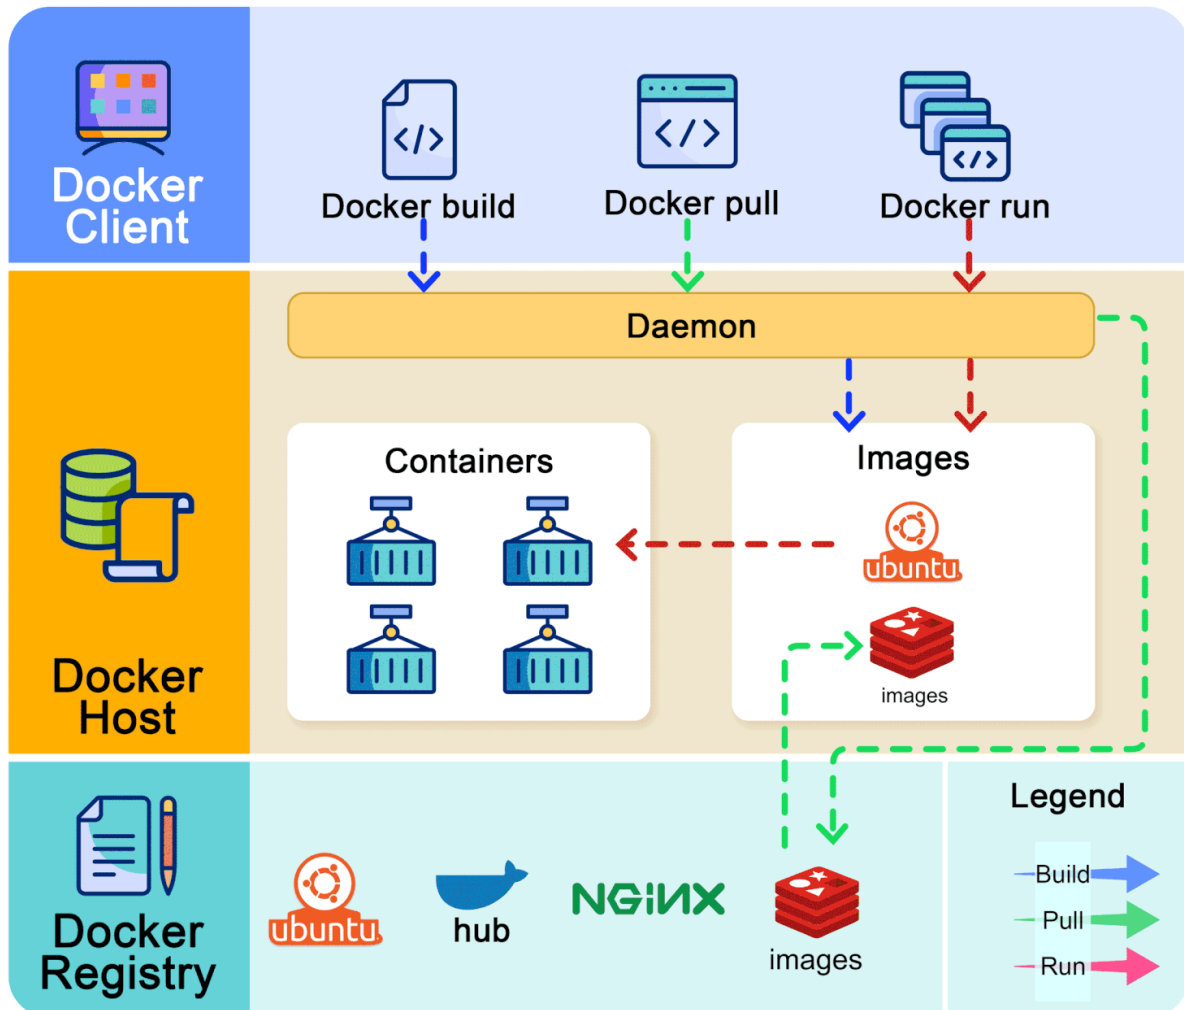

Docker's architecture comprises three main components:

- ♦ Docker Client
  This is the interface through which users interact. It communicates with the Docker daemon.

♦ Docker Host

Here, the Docker daemon listens for Docker API requests and manages various Docker objects, including images, containers, networks, and volumes.

♦ Docker Registry

This is where Docker images are stored. Docker Hub, for instance, is a widely-used public registry.
